

B-DAB-780

Conversion Revox B780/739 FM Receiver/Preamplifier to DAB+ & FM reception

A milestone in the history of Studer/Revox radio receiver production, combined with new concepts and an exemplary RF circuit design that is second to none. This receiver/preamplifier was manufactured from 1980 to 1984 and, in many locations, continues to provide indispensable service to this day. However, with the widespread introduction of digital radio using DAB+ technology, this receiver now requires an update.

The B-DAB-780 conversion kit enables the Revox B780 and B739, after around 40 years, to keep pace with current technology and receive digital DAB+ radio in the best possible quality and reproduce it in analogue form. Sustainability in its purest form. After the conversion, your receiver generates less heat and therefore consumes less energy. The batteries are also no longer required, and the inconvenience of leaking batteries is a thing of the past. After the conversion, the unit will continue to provide you with many more years of enjoyment and, as before, will always remain repairable.

The conversion is fully reversible, and no modifications are made to the unit that cannot be undone. The appearance of the unit also remains unchanged. Installation can be carried out by an experienced electronics technician or by a specialist dealer. We will be happy to help you find a suitable specialist retailer for the conversion.

The operating concept with the 10/20 direct preset buttons, the arrow buttons, and the source selection buttons is retained.

You do not need a remote control or an app on your smartphone. You operate the unit as before using the controls on the front panel. The new authentic red LED segment display shows station names and, if desired, radio text, while the analogue meter indicates reception quality. As before, the source can be displayed as a number, or now also as text.

In addition to digital DAB+ technology, the receiver can still receive and reproduce analogue FM stations. Both are available in excellent audio quality. 250 station presets are available for each technology. DAB+ radio text and FM RDS text can be activated via a settings menu if desired.

The conversion kit is developed, produced, and supplied in a small series by the Swiss company **Lost Audio GmbH** and distributed by **Sumatronic AG**.
